Let's Start!

What do you know about declarative languages?

Learning Outcome:

Understand key information about the concepts, principles, and methodologies in simple spoken and written situations. Talk about programming techniques, use cases, kinds, and sequences in simple spoken and written situations.

Can Do Statements:

- I can talk about nonprocedural languages.
- I can give examples of nonprocedural languages.
- I can understand what nonprocedural languages are.

Ask your partner:

- What's the purpose of a programming language?
- What do you think are the most common programming languages software developers use?

Let's Explore!

Stephen helps Amy with her studies.

Instructions: Read the text below.

Stephen: Hey, Amy! How are you doing?

Amy: I'm fine! I'm studying for an exam about non-procedural languages and I'm worried about it!

Stephen: How come? They are very easy. I can help you study for that exam, Amy.

Amy: Really? Thanks, Stephen. Well, what can you tell me about non-procedural languages?

Stephen: First, a non-procedural language is what some programmers call Declarative Languages. They don't require to use traditional logic or steps to perform a task. Second, non-procedural languages make people spend a little less time decoding and debugging programs.

Amy: Nice, can you give me some examples of non-procedural languages?

Stephen: Well, one of them is SQL. You can use this language for database management; most databases support SQL, therefore management and manipulation of data become reliable. Another example is PROLOG, which is a programming language for electronic devices. Next, we have HTML, which is another declarative language. People use it to create most web-pages; with HTML, you can work with different resources such as videos, images, texts, etc. Take into account that non-procedural languages focus more on the outcome rather than other things we usually take into consideration when using procedural languages.

Amy: Wow! You know a lot about non-procedural languages. Let me see if I understood what non-procedural languages are. The idea of using non-procedural languages is to spend less time debugging and coding programs.

Stephen: That's right! To conclude, a non-procedural language like WDSL describes the service language that interacts with catalogs and a language like XML develops modular vocabulary in an open format for data structures on the internet. These languages are very common, they indicate the computer what the user wants to obtain. It's very simple.

Amy: Thanks, Stephen. You're a life saver.

Let's Practice!

Amy is a little confused about non-procedural languages.

Instructions: Read the sentences. Write the missing word(s) in the blank. Use: them, it, They.

1. Amy is studying for an exam about non-procedural languages and she is worried about ____!
2. Some people know about non-procedural languages, but they call ____ declarative languages.
3. Non-procedural languages tell the computer what the user wants to obtain. ____ are very helpful.

Let's Practice!

Understanding Non-Procedural Languages

Instructions: Read the paragraph. Underline all the mistakes in the paragraph.

Some types of non-procedural languages are helpful when we work on databases. Let's mention some examples of non-procedural languages and some of their functionalities. Finally, we have SQL, and we use it for database management. First, we have PROLOG, and we use it mostly for electronic devices. Then, we have HTML, which is one of the popular programming languages. We use it to create web-pages.

Extension Activity

More about Non-procedural Languages

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for more information about types of non-procedural languages and their use.
- Create a comparative chart where you describe 3 types of non-procedural languages.
- Share your chart with the class.

Self-Assessment

Yes

No

- I look for more information about non-procedural languages.
- I create a chart to compare different types of non-procedural languages.
- I share my work with the class.

☐ ☐
☐ ☐
☐ ☐

Target Words

- fine** (adjective): admirable and excellent condition
e.g. I'm fine! I'm studying for an exam about non-procedural languages and I'm worried about it!
- debug** (verb): to clean bugs or small errors in programming
e.g. Non-procedural languages make people spend a little less time decoding and debugging programs.
- reliable** (adjective): trustable performance
e.g. Most databases support SQL, therefore management and manipulation of data become reliable.
- programming language** (noun): language used for the creation, edition and development of programs
e.g. Another example is PROLOG, which is a programming language for electronic devices.
- web-pages** (noun): a document that is part of the World Wide Web
e.g. Next, we have HTML, which is another declarative language. People use it to create most web-pages.

Learning Points

Subject and Object Pronouns Review

You use **subject and object pronouns** to replace the noun in a sentence.

Subject pronouns: We use subject pronouns to replace the subject of a sentence, this can be a person or thing.

Example:

Carlos knows a lot about nonprocedural languages, **he** is the best student of this class.

Carlos is the subject of the action and we can replace Carlos with the **subject pronoun** *he*.

Object pronouns:

You use **object pronouns** instead of using nouns when the noun is the object of a sentence.

Example:

Peter learns about programming languages. Peter wants to know everything about **them**.

Them replaces programming languages in the second sentence.

Take a look at the following chart where you will see the **subject pronouns** and their **object pronoun**.

Subject pronouns	Object pronouns
I	Me
You	You
He	Him
She	Her
It	It
We	Us
Them	Them

Examples

- A non-procedural language is what some programmers call Declarative Languages. They don't require to use traditional logic or steps to perform a task.
- Next, we have HTML, which is another declarative language. People use it to create most web-pages.
- Can you give me some examples of non-procedural languages? Well, one of them is SQL.

Learning Points

Connectors to Show Sequence

You can use **connectors** when you want to link two or more ideas.

We can use **connectors** to describe a **sequence** of ideas or actions.

Take a look at the following chart to see some of those **connectors**.

Type of Connector	Example
Ordinal numbers	First, second, third, etc.
Sequence	Then, next, after that
To conclude	To sum up, finally, to conclude

Example:

First, we are going to talk about nonprocedural languages. **Then**, we need to see which language is the most common. **After that**, we are going to focus our attention on that language. **Finally**, we are going to use it.

Examples

- *First, a non-procedural language is what some programmers call Declarative Languages.*
- *Second, non-procedural languages make people spend a little less time decoding and debugging programs.*
- *Next, we have HTML, which is another declarative language.*
