Let's Start!

Programmers use internet applications all the time!

Learning Outcome:

Understand key information about the concepts, principles, and methodologies in simple spoken and written situations. Talk about programming techniques, use cases, kinds, and sequences in simple spoken and written situations.

Can Do Statements:

- I can identify key features related to internet applications programming.
- I can obtain information about internet applications programming.
- I can exchange information about internet applications programming with my colleagues.

Ask your partner:

- What internet applications do you recommend? Why?
- What internet application would you like to design?

Let's Explore!

An Internship in the World of Software

Instructions: Read the text below.

Eduard: Hey, Janice, are you having problems with the internet applications?

Janice: Yes, I am. I guess the web server is not working.

Eduard: Don't worry, we are doing maintenance to our system right now. In the meantime, let me ask you something, do you know what an internet application is?

Janice: Well, an internet application is an internet-based interactive program, and we access these applications through a web browser. You said that today we were going to talk about internet applications programming, so I studied a little.

Eduard: I'm glad. You need to know that Internet applications programming provides us some key features that include low-level and e-commerce infrastructure, interfacing with databases, data analysis and extraction, support for searching, among others.

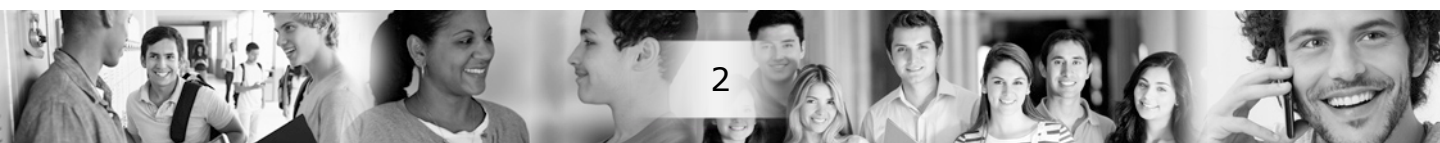

Janice: I see, I'm reading a lot about internet applications programming, and I learned that programmers use different programming languages and programming tools in order to develop applications.

Eduard: Exactly, sometimes we combine those languages and tools if necessary. You are doing a great job, Janice. What else did you read?

Janice: Well, something interesting is that programmers are using mostly C++ to build fundamental applications, and Java to build small applications.

Eduard: Impressive, I'm happy you are doing your internship in our company, co-workers like you matter a lot here. There is something I would like to share with you as my colleague. As you know, programmers are creating powerful tools to develop applications and websites, and at some point, people with not so much knowledge about programming will be able to use those tools effectively. I think that experienced programmers like me won't be necessary in the future.

Janice: That sounds possible. I think that internet applications, websites, plugins are already evolving very quickly. For example, online shopping or site-specific search engines. But, I also believe that experienced programmers will be busy developing other amazing things.

Let's Practice!

Do you remember some of the compound nouns?

Instructions: Match column A with Column B.

COLUMN A

1. Web
2. Data
3. E-

COLUMN B

- a. analysis
- b. commerce
- c. server

Let's Practice!

Janice shares some information with her colleagues, is she using compound nouns or actions verb in her statements?

Instructions: Select the best options in the table.

	Compound Noun	Action Verb
E-commerce is an online form of business.		
We access applications all the time on the internet.		
Networking and routing are examples of low-level infrastructure.		
Programmers create tools to develop applications.		

Extension Activity

Let's create a mind map to explain Internet Applications Programming!

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for more important information related to Internet Applications Programming.
- Design and make a mind map in which you explain how Internet Application Programming works and what is necessary for it.
- Compare your personal ideas about this topic with your classmates.

Self-Assessment

Yes

No

- I research on Internet Application Programming by myself.
- I create a mind map explaining Internet Application Programming, its importance and components.
- I share my mind map with my classmates and discuss my ideas about this topic with them.

☐ ☐
☐ ☐
☐ ☐

Target Words

- programming language** (noun): all the codes programmers use to write commands a computer will eventually follow
e.g. Programmers use different programming languages and programming tools in order to develop applications.
- access** (verb): to get into, to enter
e.g. We access these applications through a web browser.
- co-worker** (noun): someone who works with you, usually at the same workplace
e.g. Co-workers like you matter a lot here.

- internship** (noun): transitory job focused on some kind of training that is usually done by senior university students
e.g. I'm happy you are doing your internship in our company.
- matter** (verb): to be really important, to be vital
e.g. Co-workers like you matter a lot here.
- already** (adverb): previous done, finished or accomplished
e.g. I think that internet applications, websites, plugins are already evolving very quickly.

Learning Points

Action Verbs and Compound Nouns used in Software Programming

There are different kinds of verbs and nouns. Let's take a look at some **action verbs** and **compound nouns** related to software programming.

An **action verb** is a verb that expresses an action that a subject can actually physically **do**.

For example:

*Johnny usually **talks** about that programming language all the time!*

*Luisa **thinks** that the security software is not updated.*

A **noun** is what we use to designate people, animals, or things. A **compound noun** is the combination of two or more words; these extra words we add are usually adjectives or other nouns.

For example:

*We have to check if the **web servers** are working properly.*

*Some of these features are used by most **e-commerce web-sites**.*

*We have to see the results of the data **analysis** before we take any decision.*

Examples

- *We access these applications through a web browser.*
- *Some key features that include low-level and e-commerce infrastructure.*

Simple Present and Present Continuous in Affirmative, Negative and Questions

We use the **simple present** to talk about an action that happens regularly, and we use the **present continuous** to talk about an action that is currently in process at the moment of speaking.

Simple Present: These are the grammatical structures to use the simple present in affirmative statements, negative statements, and questions.

Learning Points

Affirmative	Subject + verb + complement.	Examples: <i>I use the computer every day.</i> <i>She reads about programming.</i>
Negative	Subject + do not (don't) does not (doesn't) + verb + complement.	<i>I don't use the computer every day.</i> <i>She doesn't read about programming.</i>
Questions	Do/Does + subject + verb + complement + ?	<i>Do you use the computer every day?</i> <i>Does she read about programming?</i>

Present Continuous: These are the grammatical structures to use the present continuous in affirmative statements, negative statements, and questions.

Affirmative	Subject + verb to be + (verb + ing) + complement.	<i>I am working on a new software.</i> <i>She is designing an application.</i>
Negative	Subject + verb to be in negative form + (verb + ing) + complement.	<i>I am not working on a new software.</i> <i>She isn't designing an application.</i>
Questions	Verb to be + subject + (verb + ing) + complement + ?	<i>Are you working on a new software?</i> <i>Is she designing an application?</i>

Contrast: We can combine these two tenses to talk about actions in present. Take a look:

*Internet-based applications **are becoming** very important for programmers, **they work** hard to develop new applications every day.*

Examples

- *Are you having problems with the internet applications?*
- *I guess the web server is not working.*
- *We are doing maintenance to our system right now.*
- *Do you know what an internet application is?*
- *You need to know that Internet applications programming provides us some key features that include low-level and e-commerce infrastructure.*

Learning Points

What is an internet application?

In computing, we call **internet applications** to the internet-based applications used by a client through a web browser.

Common internet applications are the online information search, the online communications, and the e-commerce business. Internet applications use different internet protocols to receive requests from clients, usually web browsers, in order to relay information. These applications regularly come with plug-ins such as Silverlight, Flash, or Java to facilitate the input data process. Internet applications are located on distant servers; that means that they don't perform any operation on the user's hardware. This is the biggest difference between an internet application and a desktop application.
